

Brainstorming

Introduction

Brainstorming is the process of generating ideas and identifying the best possible solution for a problem. For this project, different approaches were considered to analyse electricity consumption data efficiently and present the results in an interactive way.

Brainstorming Diagram

Brainstorming Ideas

During brainstorming, the following ideas were identified:

- Collect electricity consumption data from the dataset.
 - Store the data securely in an Oracle Database.
 - Retrieve and process data using SQL queries.
 - Create interactive Tableau dashboards.
 - Develop Tableau Stories to explain the analysis.
 - Publish dashboards to Tableau Public.
 - Build a Flask web application.
 - Embed Tableau Dashboard and Story into the website.
 - Allow users to filter data by Year, State, Region, and Sector.
 - Make the application simple, interactive, and user-friendly.
-

Challenges Identified

- Handling large amounts of electricity consumption data.
- Integrating Oracle Database with Tableau.

- Publishing dashboards to Tableau Public.
 - Embedding Tableau into Flask.
 - Designing a responsive and user-friendly interface.
-

Final Brainstorming Outcome

After evaluating different ideas, the selected solution was:

- Oracle Database for data storage.
 - SQL for querying and managing data.
 - Tableau for interactive dashboards and stories.
 - Tableau Public for publishing visualizations.
 - Flask for developing the web application.
 - GitHub for version control and project hosting.
-

Conclusion

The brainstorming session helped identify the most suitable technologies and workflow for the Electricity Consumption Analysis project. By combining Oracle Database, SQL, Tableau, and Flask, the project provides an efficient and interactive solution for analyzing electricity consumption data.
