

1. Introduction

The proposed solution aims to simplify the analysis of electricity consumption data by integrating Oracle Database, SQL, Tableau, and Flask into a single system. The application provides interactive dashboards and stories that help users analyze electricity consumption across different states, regions, sectors, and time periods.

2. Proposed Solution

The proposed system consists of the following steps:

1. Collect electricity consumption data from the dataset.
 2. Store the data in the Oracle Database.
 3. Execute SQL queries to retrieve and organize the required information.
 4. Connect Tableau Desktop to the Oracle Database.
 5. Create dashboards and stories using Tableau.
 6. Publish dashboards and stories to Tableau Public.
 7. Embed the published dashboard and story into a Flask web application.
 8. Allow users to access interactive reports through the website.
-

3. Proposed Solution Workflow

4. Features of the Proposed System

- Interactive Dashboard
 - Tableau Story
 - State-wise Analysis
 - Region-wise Analysis
 - Sector-wise Analysis
 - Monthly Trend Analysis
 - Interactive Filters
 - Web-based Access
 - Public Dashboard Sharing
-

5. Advantages

- Reduces manual effort.
 - Provides interactive visualizations.
 - Faster data analysis.
 - Better decision-making.
 - Easy access through a web browser.
 - User-friendly interface.
-

6. Expected Outcome

The proposed solution provides an efficient platform for electricity consumption analysis by combining database management, SQL processing, visualization, and web technologies.

7. Conclusion

The proposed solution integrates Oracle Database, SQL, Tableau, and Flask into a complete data analysis system. It improves accessibility, visualization, and decision-making through interactive dashboards and stories.
