

1. Introduction

The Solution Architecture describes the overall structure of the Electricity Consumption Analysis system. It illustrates how data flows between different software components, starting from the dataset and ending with the user interface.

2. Architecture Diagram

3. Component Description

Component	Description
CSV Dataset	Stores electricity consumption records.
Oracle Database	Stores and manages data.
SQL Queries	Retrieves and processes information.
Tableau Desktop	Creates dashboards and stories.
Tableau Public	Publishes dashboards online.

Component	Description
Flask	Hosts the website and embeds Tableau.
User	Accesses dashboards through a browser.

4. Working Principle

1. Electricity consumption data is collected in CSV format.
 2. Data is stored in the Oracle Database.
 3. SQL queries retrieve the required information.
 4. Tableau Desktop creates dashboards and stories.
 5. Tableau Public hosts the dashboards online.
 6. Flask embeds the dashboards into the website.
 7. Users interact with dashboards using filters and visualizations.
-

5. Advantages

- Modular architecture.
 - Easy to maintain.
 - Interactive data visualization.
 - Web accessibility.
 - Scalable design.
 - Improved decision-making.
-

6. Conclusion

The proposed architecture provides a structured and scalable approach for electricity consumption analysis. It integrates data storage, processing, visualization, and web technologies into a single workflow, making the system efficient and user-friendly.
