

Final Report

Abstract

The Electricity Consumption Analysis project provides an interactive platform for analysing electricity consumption across different states, regions, and sectors. Oracle Database is used for storing data, SQL for querying, Tableau for creating dashboards and stories, and Flask for developing a web application. The project enables users to explore electricity consumption trends through interactive visualizations and supports better decision-making.

Future Scope

- Real-time electricity data integration
 - Machine Learning for consumption forecasting
 - Mobile application support
 - User authentication
 - Cloud deployment
 - AI-powered analytics
-
